Upcoming Events

2021 AMERICAN SUSTAINABILITY FILMS, SUNDAY, APRIL 11, 10:00 AM - 4:00 PM - SNOWDROP COLLEGE
The fall brings workshops, presentations, and the community together to celebrate its 5th anniversary with a day of sustainability films. Snowdrop College is a non-profit organization that provides free workshops and presentations to homeowners, small businesses, and other community groups. Learn more about events, and environmental education.

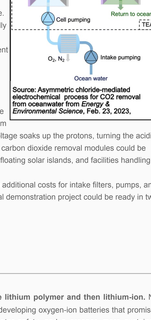
acidification that seriously damages the marine environment. The total amount of CO2 entering ocean water rivals that entering the atmosphere. The actual concentration of the gas, on a volumetric basis, is substantially higher in ocean water than in the ambient air. 100 mg/liter vs 0.77 mg/litter. Effective means for its removal from ocean water could augment the other negative emissions technologies.

Existing methods for removing carbon dioxide from seawater require membranes or chemicals, which make the process complex and expensive. Researchers at MIT developed a system made of two electrochemical cells. One converts the carbonate and bicarbonate in the water to carbon dioxide. A vacuum chamber removes carbon dioxide from the water as it passes through into the second cell in which a reverse voltage soaks up the protons, turning the acidic water back to alkaline, so it can be released back into the ocean. These carbon dioxide removal modules could be installed on cargo ships, on platforms located near offshore wind farms, floating solar islands, and facilities handling seawater -- like ocean water desalination plants.



Source: Asymmetric chloride-mediated electrochemical process for CO2 removal from oceanwater from *Energy & Environmental Science*, Feb. 23, 2023.

The estimated cost of the system is between $50-100/ton of CO2 (plus additional costs for intake filters, pumps, and gas separation) vs. $250–600 per ton for direct air capture. The practical demonstration project could be ready in two years.

Battery Energy Storage System (BESS)

Until recently, the major contenders for battery chemistry were lithium polymer and then lithium-ion. Now researchers at the Technische Universität Wien in Vienna, Austria, are developing oxygen-ion batteries that promise to be an improvement over currently used chemistry while offering greater safety, and a greener, more sustainable footprint. Their plates are made of non-combustible, ceramic materials, and the batteries do not require rare-earth elements. The ability of oxygen-ion batteries to receive a charge does not diminish over time and can be constantly recharged without breaking down, unlike lithium-based batteries. The major disadvantages of these BESTs getting very hot during operations (200 - 400°C) and having low energy density, thus not being appropriate for consumer uses.

- gasworld.com/

Iron-air batteries were first developed in the 1960s by NASA. This technology has the potential to overcome several key issues with lithium-based batteries. Iron is the fourth most abundant element on Earth, which overcomes a significant problem with using lithium: the element's rarity.

Form Energy, a Massachusetts energy storage and battery technology company is developing iron-air battery technologies which can help address the demands of the global electric system.

The company's flagship commercial product is a washing machine-sized iron-air battery. Each unit holds approximately 50 iron-air cells, surrounded by an electrolyte.

Key to their operation is the principle of "reverse rusting" wherein the cells "breathe" in air. In this process, iron is transformed into iron oxide, producing energy. The reaction can be reversed by applying a current and converting the iron oxide back into iron.

Lithium-ion batteries provide about four hours of energy storage capacity. Iron-air batteries could provide up to one hundred hours of storage. They do, however, have major disadvantages compared to lithium-ion batteries, they are big and recharge slowly.

Iron-air batteries can act as a bridging technology during energy gaps, such as on cloudy days, which would otherwise limit solar power plants.

EnerVenue will open in Kentucky a major manufacturing facility to produce battery energy storage systems applying nickel-hydrogen battery technology. The technology was originally developed for aerospace applications in 2017. Stanford researchers redesigned the vessel, moving it toward commercialization by improving performance and reducing cost.

According to the company, the batteries operate best in ambient temperatures from -40 F to 140 F. The battery purportedly comes with no risk of fire or thermal runaway and includes no toxic materials, so it is also recyclable.

The company claims that its batteries have a more than 30-year lifespan, can go through more than 30,000 cycles without experiencing degradation and offer exceptional overcharge, over-discharge, and deep-cycle capabilities.

The Reads

Plans that would bury carbon underground rather than release it in the air **have stoked debate over climate and property rights.**

There is no question that technology exists to remove carbon from industrial sites and to transport and store it underground. Less clear: Is carbon capture really an effective counterweight to the overheating planet? And, if so, at what cost?

Miscellany

Strategic placement of EV charging is recommended **by MIT researchers:**

1. In workplaces, better availability could help to absorb peak power being produced at midday from solar power installations. It would also utilize higher mid-day PV electricity production, some of which may go to waste, and reduce evening and overnight electricity demand.
2. At homes, broadly individual and apartment building garages, and parking areas. Pre-programmed EV chargers installed on residential streets could be accompanied by a simple app to delay the start of the charging cycle to meet other following day's transportation schedule.

Combining the two measures --- workplace charging and delayed home charging --- would reduce peak electricity demand, store solar energy, and conveniently meet drivers' charging needs on all days, according to study results. In addition, this setup would eliminate the need for networked centrally controlled devices.

OPINION .

Restoring American energy independence. By reps. Kevin Hern (R-OK) and August Pfluger (R-TX), opinion contributors.

(***Warning:*** *Not a word about the impact of fossil fuels on the climate and the future of the planet* (Ed.))

(According to the opinion writers,) the House Energy Action Team (HEAT) is committed to restoring and exceeding the energy independence that resulted from the shale revolution. In 2019, the United States became a net exporter of oil and gas for the first time since 1952. The economy thrived as the U.S. reduced its reliance on foreign energy. The Biden administration wasted no time destroying that progress. Following through on his campaign promise to "end fossil fuel", Biden canceled the Keystone XL pipeline (that should be delivering 830,000 barrels of oil per day to the U.S.) and unilaterally blocked oil and gas lease sales in his first week in office. This war on traditional energy was just the tip of the iceberg, as Biden has worked to impose similar draconian policies into Americans' kitchens and retirement savings.

The New York Solar Energy Society (NYSES)

a Chapter of the American Solar Energy Society (ASES)

prepares consumer knowledge handouts about energy conservation and renewable energy, and distributes Green Energy Times, a resource publication, to the public throughout eastern New York State. NYSES analyses legislation and state programs and visits with the staff of legislators in New York City, New York State, and Washington, DC. NYSES is a volunteer, grassroots, membership organization serving the children, families, engineers, architects, and teachers of New York State since 2007.

Our Mission:

To encourage the understanding and use of solar energy technologies through public outreach, to be a source of sound technical knowledge, and to provide a forum to address critical regional and state issues relating to solar energy solutions. We address the energy usage of all segments of society by increasing awareness of the benefits of renewables: solar, wind, biomass, geothermal ground source, tidal/wave energy, and energy efficiency.
